CHAPTER 1: Energy Reserves and Potential

Introduction

Energy reserves are part of the energy resources that, based on technical, economic and other relevant (e.g. environmental) considerations, can be recovered and for which extraction is justified.

The exact definition of reserves depends on the kind resources in focus.

Global Classification of Energy Reserves

The classification of energy reserves is guided by the United Nations Framework Classification for Fossil Energy and Mineral Reserves and Resources (UNFC 2009).

This framework evaluates resources based on: Economic and Social Viability, Field Project Status and Feasibility, and Geological Knowledge.

- Class A: Commercially recoverable resources.
- Class B: Potentially commercially recoverable resources.
- Class C: Non-commercial and other known deposits.

Energy Reserves in India

India has a diverse range of energy resources, with significant reserves of both fossil fuels and renewable energy potential.

The country's energy mix is undergoing a transformation to reduce dependence on fossil fuels and promote the use of renewable energy sources, driven by environmental, economic, and macroeconomic consideration.

This chapter highlights the energy reserves and potential in India, focusing on both fossil fuels and renewable energy resources. It explores coal, lignite, crude oil, natural gas, and renewable energy potential, providing an overview of the country's energy landscape.

Estimated Reserves of Coal in India as on 01.04.2025

Fig 1.1 Estimated Reserves of Coal in India as on 01.04.2025

Estimated Reserves of Lignite in India as on 01.04.2025

Fig 1.2 Estimated Reserves of Lignite in India as on 01.04.2025

1.1 Coal Reserves

India is home to one of the largest proven coal reserves in the world. As of 01-04-2025, the total estimated coal reserves were 400.7 billion tonnes, showing an addition of 11.29 billion tonnes compared to the previous year.

This marks a growth of 2.90% in total coal reserves during the year 2024-25(P) over the previous year (2023-24) (Table 1.1).

The distribution of coal reserves in India is concentrated in a few states like Odisha, Jharkhand and Chhattisgarh. These three states account for approximately 70% of the total coal reserves in the country. Out of the total reserves in the country, proven reserves i.e. economically viable and geologically confirmed account for approximately 55% of the total estimated coal reserves as depicted in the figure 1.1.

1.2 Lignite Reserves

1.3 Crude Oil Reserves

As of 01-04-2025, the estimated reserves of crude oil in India stood at 672.07 million tonnes, compared to 671.40 million tonnes in the previous year, reflecting a 0.10% increase over the last year (Table 1.3).

Geographically, the maximum crude oil reserves in India are concentrated in the Western Offshore region, which accounts for 31% of the total crude oil reserves. This is followed by the Assam region, which holds around 22% of the country's crude oil reserves as shown in figure 1.3.

Fig 1.3: Estimated Reserves of Crude Oil in India as on 01.04.2025

1.4 Natural Gas Reserves

The estimated reserves of natural gas as of 01-04-2025 were 1,073.01 Billion Cubic Meters (BCM) compared to 1,094.19 Billion Cubic Meters (BCM) in the previous year, reflecting a decrease of 1.94% over the last year (Table 1.4).

The largest reserves of natural gas in India are located in the Western Offshore region, which holds approximately 32% of the total natural gas reserves. This is followed by the Eastern Offshore, which accounts for 25% of the reserves as shown in figure 1.4.

Fig 1.4: Estimated Reserves of Natural Gas in India as on 01.04.2025

1.5 Renewable Energy Potential in India

India is increasingly focusing on renewable energy sources as part of its sustainable development and mitigating impact on climate. As of March 31, 2025, the total estimated potential for renewable power generation in India stood at 47,04,043 MW.

This potential comes from a variety of renewable sources, including wind, solar, biomass, small hydro, and cogeneration from bagasse (Table 1.4). Figure 1.5 shows the potential is spread across several key renewable energy sources, as detailed below:

Source wise Estimated Potential of Renewable Power in India as on 31.03.2025

Fig 1.5: Source wise Estimated Potential of Renewable Power in India as on 31.03.2025

Solar Power: India has immense potential for solar power generation, estimated at 33,43,378 MW, which accounts for 71% of the total renewable energy potential. Solar power stands as the most significant source of renewable energy in India.

Wind Power: With an estimated potential of 1,16,38,56 MW (close to 25% of total renewable energy potential), it has the potential to contribute significantly in shaping the renewable energy-generation scenario of India.

Large Hydropower (Large Hydro): The potential for large hydropower generation is estimated at 133,410 MW, contributing 2.84% to the country's renewable energy potential.

Small Hydro Power (SHP): India also has a notable potential of 21,134 MW (0.45%) from small hydro power projects.

Biomass Power: Biomass, which includes agricultural waste, forest residues and other organic matter, has a potential of 28,447 MW, accounting for 0.60% of the total renewable power potential.

Cogeneration from Bagasse: India has a specific potential of 13,818 MW (0.29%) from bagasse-based

Geographical Distribution of Renewable Energy Potential

The geographical distribution of renewable energy potential in India (Figure 1.6) shows significant regional variations. The states with the highest renewable energy potential, as of March 31, 2025, are: Rajasthan, Maharashtra, Gujarat, Andhra Pradesh, and Karnataka.

Together, these five states account for around 65% of India's total renewable energy potential, highlighting their critical role in India's renewable energy future.
